

System Intelligence Laboratory

WONIK-KAIST FTC 기술 전수 세미나: Decision-Making with Data-Driven Model

*Dept. of Industrial & Systems engineering, KAIST
Chihyeon Song, Haewon Jung, Jinkyoo Park*

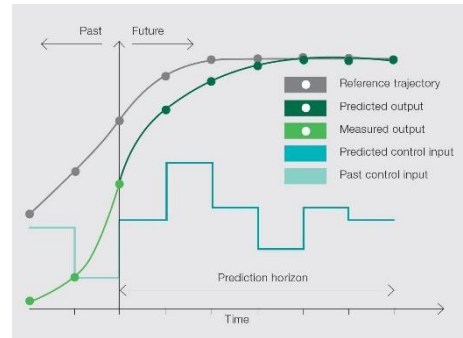

Decision-Making

- Decision-making: What we really want to do

Model-based optimizations

$$\begin{aligned} \min_{u_1, \dots, u_T} & \sum_{t=1}^T c(x_t, u_t) \\ \text{s.t.} & x_{t+1} = f(x_t, u_t) \end{aligned}$$

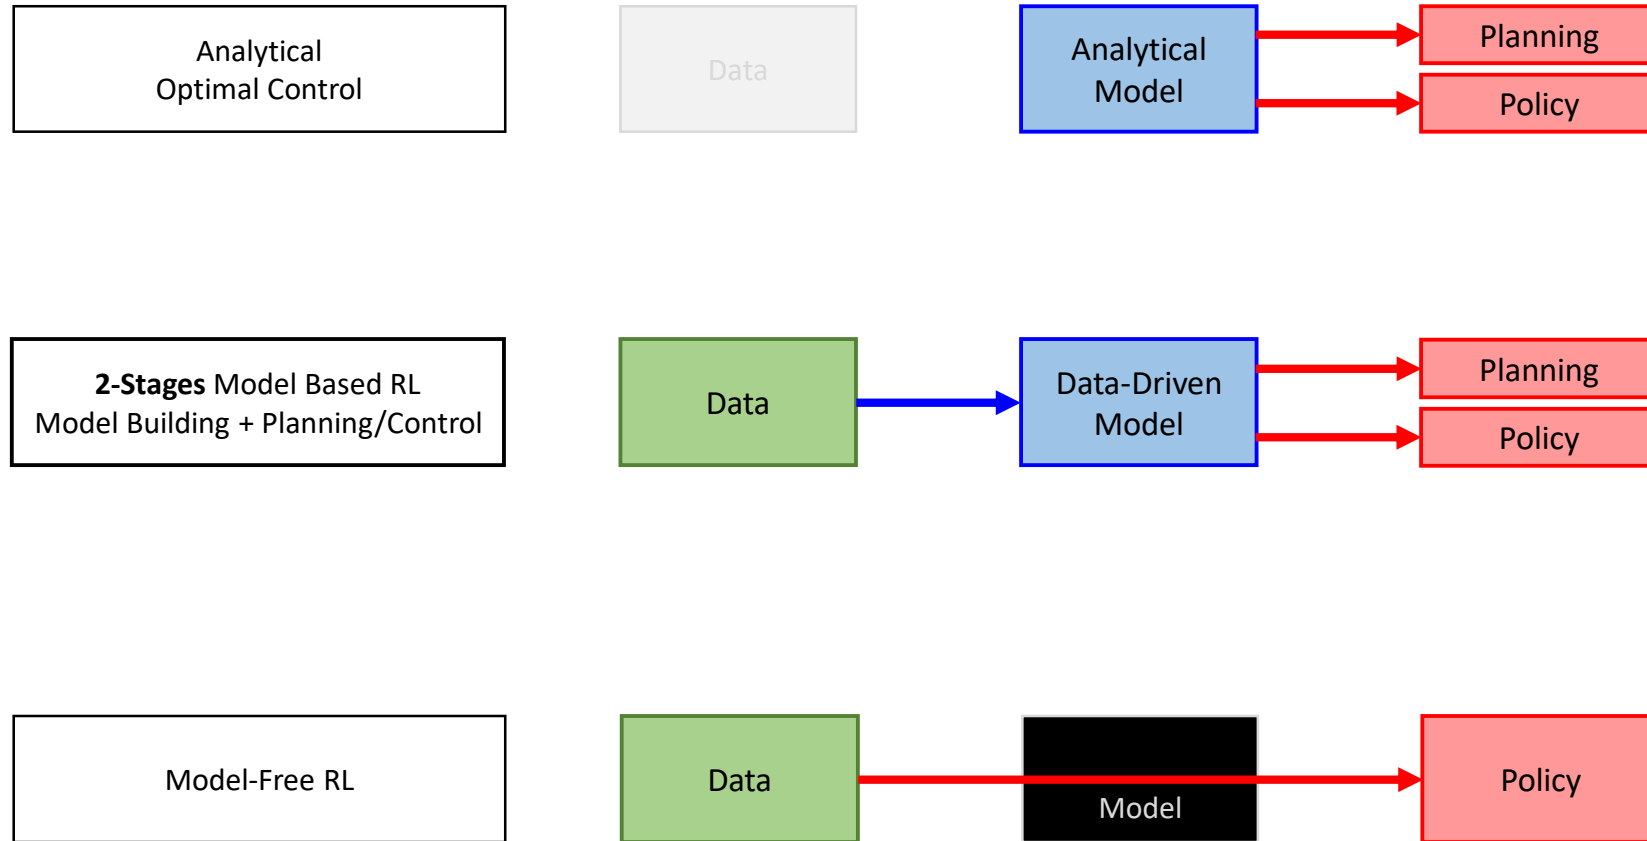

Optimal controls

Anomaly detections

Ways to Make a Decision

Decision-Making with Data-Driven Models

- Data: discrete value that contains information

Weather

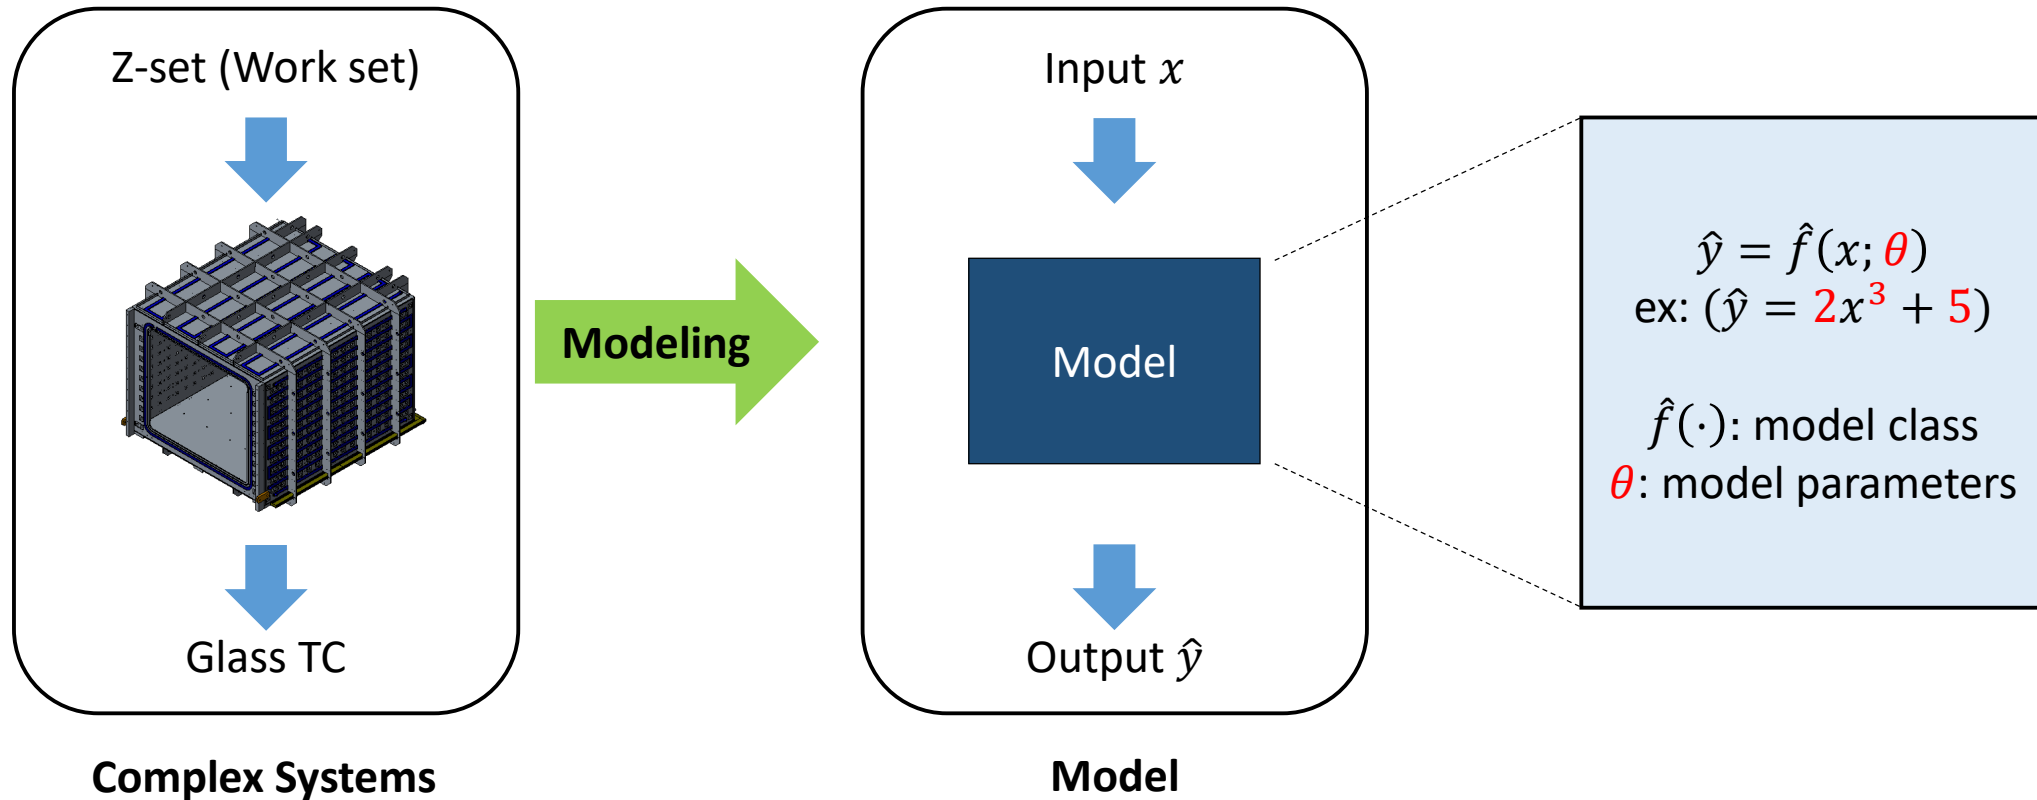

SNS

Image

Decision-Making with Data-Driven Models

- Model: Theoretical representation of a system
 - Will be used in decision-making instead of the actual system

Decision-Making with Data-Driven Models

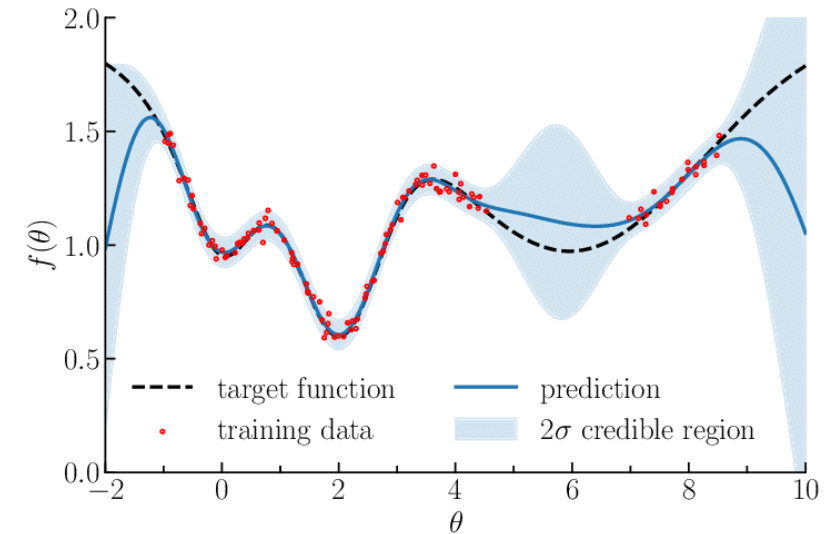

- Data-driven model: Model parameters are *learned* from the data
 - Collect the information from the data in terms of modeling

Linear model

Deep neural networks

Gaussian process

Why Data-Driven Decision-Making?

- Complexity of modern systems
 - Data-driven approach doesn't require any background knowledge of the system

$$\frac{\partial}{\partial x} \left(k \frac{\partial T}{\partial x} \right) + \frac{\partial}{\partial y} \left(k \frac{\partial T}{\partial y} \right) + \frac{\partial}{\partial z} \left(k \frac{\partial T}{\partial z} \right) + q_v = \rho c_p \frac{\partial T}{\partial t}$$

where

k is the materials conductivity [$\text{W.m}^{-1}.\text{K}^{-1}$]

q_v is the rate at which energy is generated per unit volume of the medium [W.m^{-3}]

ρ is the density [kg.m^{-3}]

c_p is the specific heat capacity [$\text{J.kg}^{-1}.\text{K}^{-1}$]

Scientific Knowledge

Modern Complex Systems

Why Data-Driven Model?

- In the real-world, we often have limited amount of data
- With an appropriate model, more data-efficient than model-free approach
 - More practical approach to the real-world systems

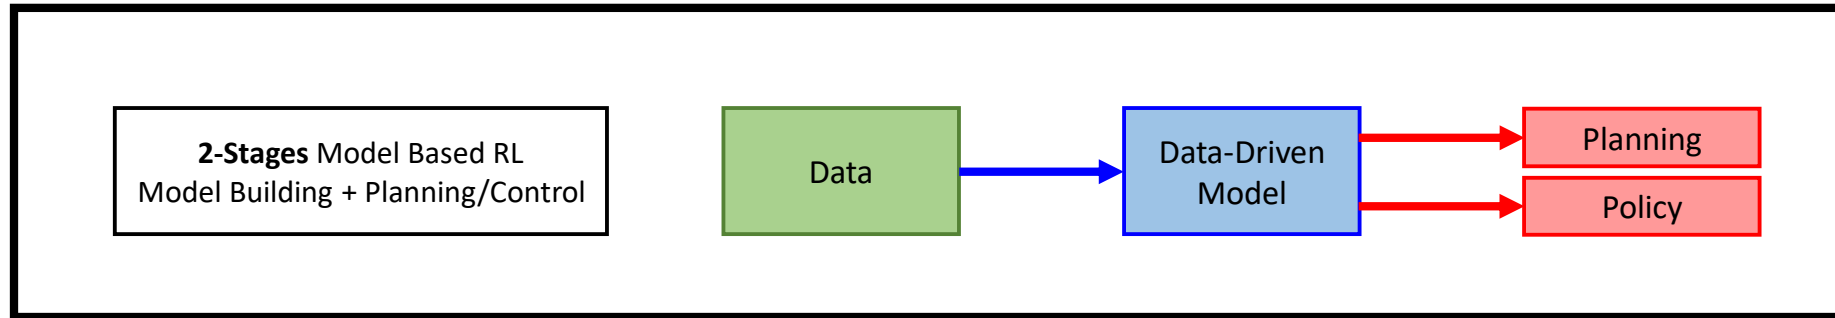

CartPole

LunarLander

How to Make a Decision

Two Big Questions

Q1. How we build data-driven model?

- Formulate System
- Model Selection
- Data Preprocessing
- Learn Model

	A	B	C	D	E	F
1	12/9/2018 11:00	\$1,400	\$1,400	\$1,300	\$1,400	0

13	12/9/2018 5:00	\$1,300	\$1,380	\$1,140	\$1,180	-12
14	12/9/2018 4:30	\$1,090	\$1,420	\$1,050	\$1,290	-13

Q2. How we make a decision with model?

- Define Decision-Making
- Formulate Optimization Problem
- Solve Control Optimization
- Validate Control Performance

$$\begin{aligned} \min_x \quad & f(x) \\ \text{s.t.} \quad & g_i(x) \leq 0 \quad \forall i = 1, \dots, I \\ & h_j(x) = 0 \quad \forall j = 1, \dots, J \end{aligned}$$

```
%% Optimization problem
% Objective function
f = @(x) 0.5*x(1)^2 + 0.5*x(2)^2;
% Constraints
g = @(x) [x(1)-1; x(2)-1; x(1)+x(2)-1];
h = @(x) [0; 0];
% Initial guess
x0 = [0; 0];
% Optimization options
options = optimoptions('fmincon','Display','none','Algorithm','quasi-newton');
% Solve the optimization problem
[x_opt,f_opt] = fmincon(f,x0,[],[],[],[],[],[],[],options);
% Display the results
disp('Optimization results:');
disp(['x_opt = ', num2str(x_opt)]);
disp(['f_opt = ', num2str(f_opt)]);
```

Two Big Questions

Q1. How we build data-driven model?

- Formulate System
- Model Selection
- Data Preprocessing
- Learn Model

Day 1

Q2. How we make a decision with model?

- Define Decision-Making
- Formulate Optimization Problem
- Solve Control Optimization
- Validate Control Performance

$$\begin{aligned} \min_x \quad & f(x) \\ \text{s. t.} \quad & g_i(x) \leq 0 \quad \forall i = 1, \dots, I \\ & h_j(x) = 0 \quad \forall j = 1, \dots, J \end{aligned}$$

```
%% Optimization problem
% Objective function
f = @(x) 0.5*x(1)^2 + 0.5*x(2)^2;
% Constraints
g = @(x) [x(1)-1; x(2)-1];
h = @(x) [x(1)+x(2)-2];
% Initial guess
x0 = [0; 0];
% Solve the problem
[x_opt, f_opt] = fmincon(f, x0, g, h, [], [], [], [], [], []);
```

Day 2

Q2. How We Make a Decision with Model?

We have a Model Now. And What?

- (Recap) Role of Model: Substitute the true system in decision-making
- With the model, we can 1) plan the future action or 2) learn a policy

How to Make a Decision

Planning vs Policy

$$\operatorname{argmin}_{u_{1:W}} \left\{ \sum_{t=1}^W \gamma^t (\hat{x}_t - r_t)^2 + \lambda \sum_{t=1}^W (u_t - u_{t-1})^2 \right\}$$

s. t. $\hat{x}_{1:W} = f(x_0, u_{1:W})$
 $u_{\min} \leq u_{1:W} \leq u_{\max}$

Planning

$$u^* = \min_u \mathcal{L}(x, u)$$

Theorem 1 (Policy Gradient). For any MDP, in either the average-reward or start-state formulations,

$$\frac{\partial \rho}{\partial \theta} = \sum_s d^\pi(s) \sum_a \frac{\partial \pi(s, a)}{\partial \theta} Q^\pi(s, a). \quad (2)$$

Proof: See the appendix.

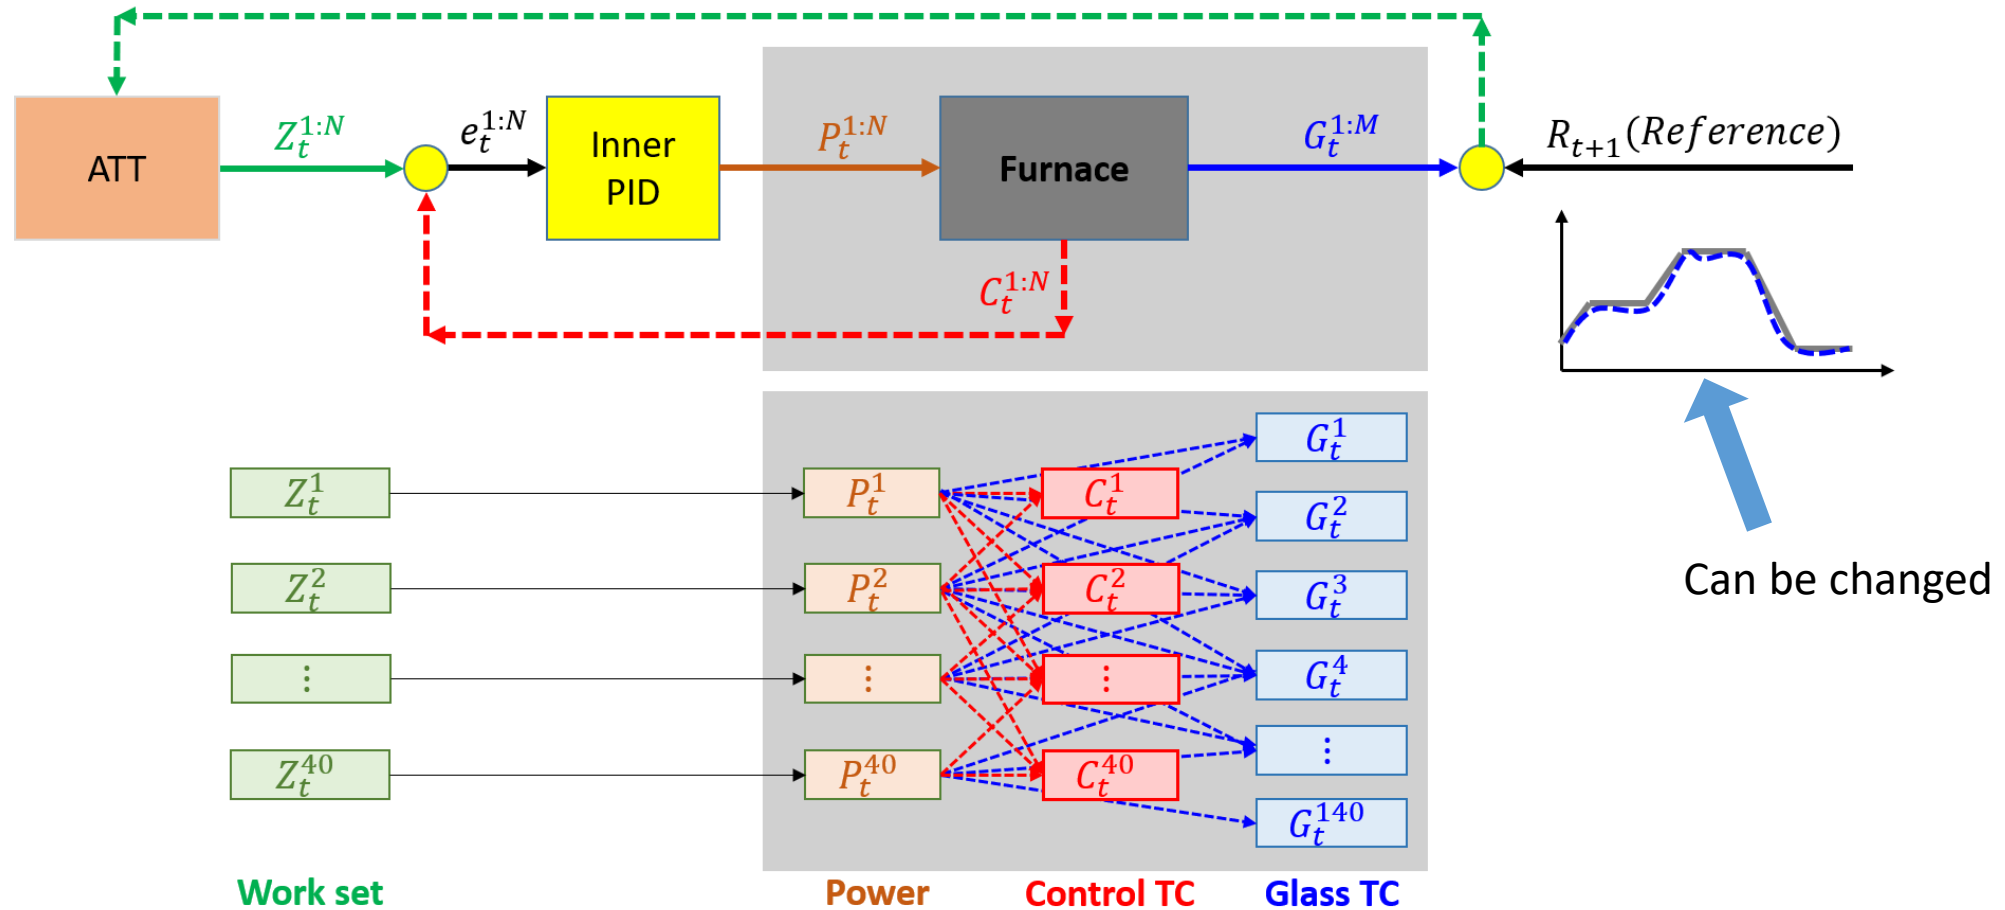

Policy

$$u^* = \pi(x_t)$$

Why Planning in FTC?

- Human can understand the decision-making logic
 - Decision is decided by solving optimization problem
- Easily adapt when the control goal is changed
 - Policy (often) assumes that the control goal is fixed

FTC Control Objective

Model Predictive Control (MPC)

모델 (Model)을 가지고 미래를 예측 (Predictive) 을 하면서, 제어 (Control) 하겠다.

$$\begin{aligned} \min_{\{u_\tau\}_{\tau=t}^{t+H-1}} & \sum_{\tau=t+1}^{t+H} \|\hat{x}_\tau - r_\tau\|^2 \\ \text{s. t. } \hat{x}_{\tau+1} &= \hat{f}(x_\tau, u_\tau; \theta) \end{aligned} \quad \longrightarrow \quad \{u_\tau\}_{\tau=t}^{t+H-1} \leftarrow \text{MPC}(x_t, \{r_\tau\}_{\tau=t+1}^{t+H}; \hat{f})$$

Model Predictive Control (MPC)

모델 (Model)을 가지고 미래를 예측 (Predictive) 을 하면서, 제어 (Control) 하겠다.

Step 1: 데이터를 활용하여 동적 모델 학습/업데이트

- 학습된 동적 모델: $G_{\tau+1}^{1:M} = f(G_{\tau}^{1:M}, Z_{\tau}^{1:N})$: f 는 linear model, Neural Network, Graph Recurrent Network,....
- 학습된 관측 모델: $G_{\tau}^{1:M} = g(C_{\tau}^{1:N})$ (세팅 과정에서 클래스 TC 관측가능하다고 가정하므로 1차년도 사용x)

Step 2: MPC를 활용하여 실시간으로 최적 work set 값 최적화

$$\min_{Z_t^{1:40}} \frac{1}{W} \sum_{\tau=t}^W \sum_{i=1}^{140} (\hat{G}_{\tau+1}^i - R_{\tau+1}^i)^2$$
$$\text{s. t. } \hat{G}_{\tau+1}^{1:140} = f(G_{\tau}^{1:140}, Z_{\tau}^{1:40})$$

Execute the first action:

$Z_t^{1:40}$

Observe

$G_{t+1}^{1:140}$

$$\min_{Z_{t+1}^{1:40}} \frac{1}{W+1} \sum_{\tau=t+1}^{W+1} \sum_{i=1}^{140} (\hat{G}_{\tau+1}^i - R_{\tau+1}^i)^2$$
$$\text{s. t. } \hat{G}_{\tau+1}^{1:140} = f(G_{\tau}^{1:140}, Z_{\tau}^{1:40})$$

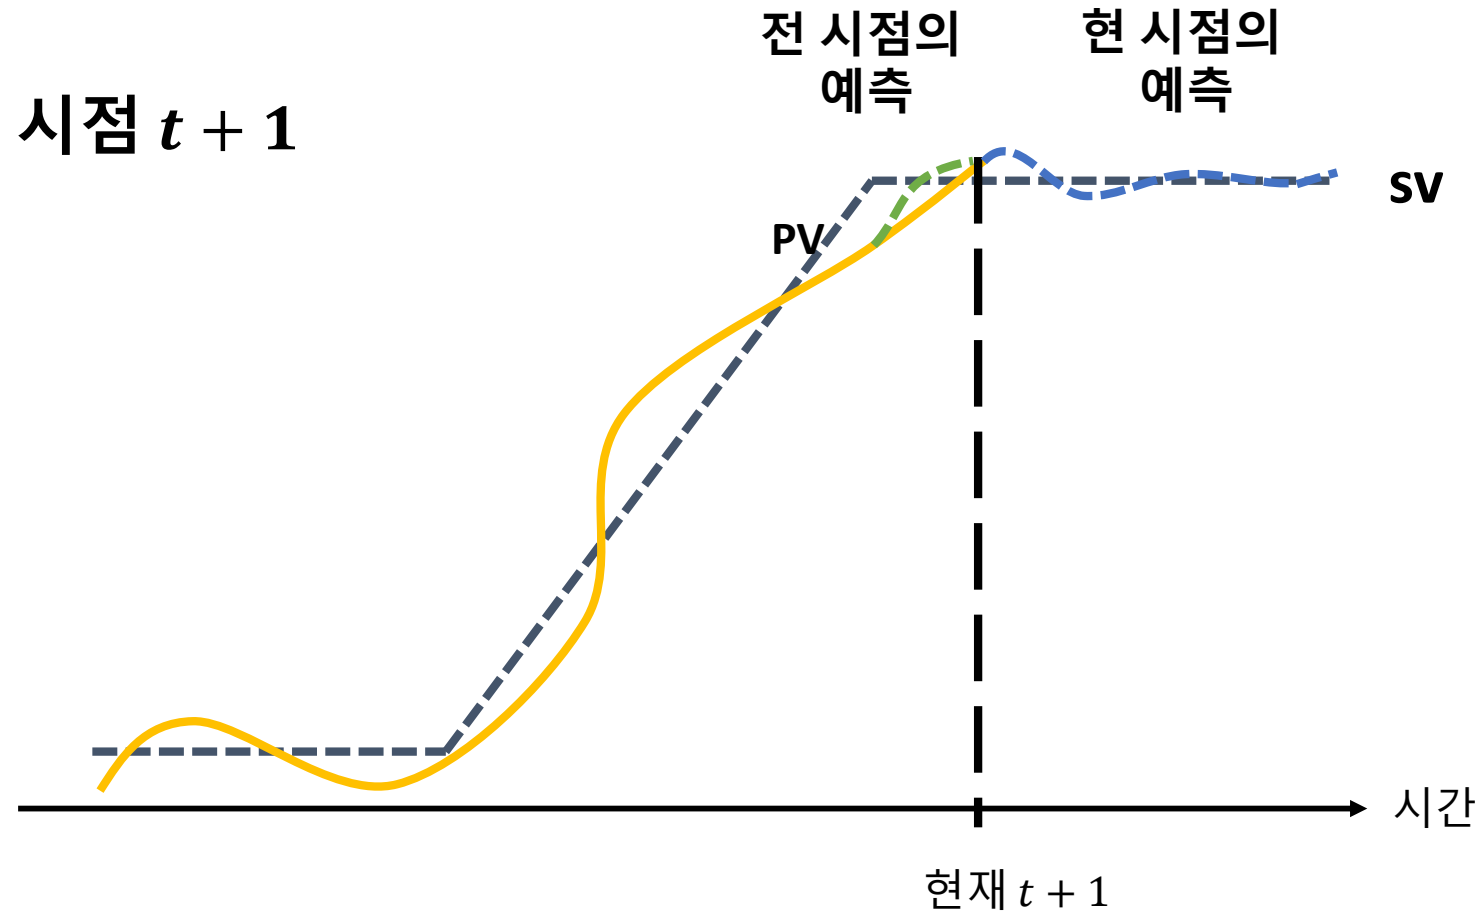

...

MPC를 활용한 제어 (1)

- (1) $\{u_\tau\}_{\tau=t}^{t+H-1} \leftarrow \text{MPC}(x_t, \{r_\tau\}_{\tau=t+1}^{t+H}; \hat{f})$
- (2) u_t 실행

MPC를 활용한 제어 (2)

- (1) $\{u_{\tau}\}_{\tau=t+1}^{(t+1)+H-1} \leftarrow MPC \left(x_{t+1}, \{r_{\tau}\}_{\tau=t+2}^{(t+1)+H}; \hat{f} \right)$
- (2) u_{t+1} 실행

Comparison between PID and MPC

PID

Consider Past & Present error

MPC

Consider Past, Present & Future

Build Control Optimization Problem

- Control objective: Make glass TC track the reference trajectory
 - Learned model is used to predict the future glass TC
 - Valid workset value is between \underline{u} and \bar{u}

- Mathematically,

$$\begin{aligned} \min_{u_{0:H-1}} & \frac{1}{H} \sum_{t=1}^H \|\hat{x}_t - r_t\|^2 \\ \text{s. t. } & \hat{x}_{t+1} = \hat{f}(\hat{x}_t, u_t; \theta) \\ & \underline{u} \leq u_t \leq \bar{u} \end{aligned}$$

- Wait, can we solve ‘constrained optimization’ via Gradient descent algorithm?

Projected Gradient Descent

- One way to solve constrained optimization

$$\min_{x \in \mathcal{X}} f(x)$$

- Key idea: After each gradient update, project update x into feasible set \mathcal{X}
 - $y_{t+1} = x_t - \alpha_k \nabla f(x_k), x_{t+1} = \operatorname{argmin}_{x \in \mathcal{X}} \|x - y_{t+1}\|^2$
- If $f(\cdot)$ is convex and \mathcal{X} is a convex set,
 - We can guarantee the global optimal solution
 - In our case, objective is quadratic & feasible space is box space: $[\underline{u}, \bar{u}]$

Code Exercise: Control Mini-Furnace via MPC + Multistep Linear

- Mini-Furnace
 - 5 Glass TC and 3 Workset
 - Goal: Control Workset so that glass TC tracks the reference trajectory
- Task 1. Train a Multistep linear model that mimics the Mini-furnace
- Task 2. Control the Mini-furnace via MPC with learned Multistep linear model

Reference Trajectory

Again, Real-World is Different...

- Need constraints for safety & stable control
- Limited time budget, need to boost the optimization speed

Boost Optimization Speed

- Good initial solution
 - Use optimal solution of previous timestep as an initial solution
- Learning rate scheduler
 - If the current solution is near-optimal, decrease the learning rate
- Time-out constraint
 - If computation time is over 5 seconds, finish algorithm and return the current-best solution

Safety Constraints

- In FTC, we cannot dramatically change Workset within 5 seconds
- Add **smoothness term** in the objective function

$$\begin{aligned} \min_{u_{0:H-1}} & \frac{1}{H} \sum_{t=1}^H \|\hat{x}_t - r_t\|^2 + \lambda \frac{1}{H} \sum_{t=1}^H \|u_t - u_{t-1}\|^2 \\ \text{s. t. } & \hat{x}_{t+1} = \hat{f}(\hat{x}_t, u_t; \theta) \\ & \underline{u} \leq u_t \leq \bar{u} \end{aligned}$$

λ : smoothness lambda

Modify Objective Function for Better Control

- One of important control goal: reduce the overshoot on the stable range
- To reduce the overshoot, give different weights

$$\begin{aligned} \min_{u_{0:H-1}} \quad & \frac{1}{H} \sum_{t=1}^H \left(\omega \|\hat{x}_t - r_t\|_+^2 + \|\hat{x}_t - r_t\|_-^2 \right) + \lambda \frac{1}{H} \sum_{t=1}^H \|u_t - u_{t-1}\|^2 \\ \text{s.t.} \quad & \hat{x}_{t+1} = \hat{f}(\hat{x}_t, u_t; \theta) \\ & \underline{u} \leq u_t \leq \bar{u} \end{aligned}$$

ω : overshoot weight

Limit Feasible Space

- If reference temperature is 300°C, then appropriate Workset will be between $300 \pm \alpha^\circ\text{C}$

$$\begin{aligned} \min_{u_{0:H-1}} & \frac{1}{H} \sum_{t=1}^H (\omega \|\hat{x}_t - r_t\|_+^2 + \|\hat{x}_t - r_t\|_-^2) + \lambda \frac{1}{H} \sum_{t=1}^H \|u_t - u_{t-1}\|^2 \\ \text{s.t. } & \hat{x}_{t+1} = \hat{f}(\hat{x}_t, u_t; \theta) \\ & r_t - u_{range} \leq u_t \leq r_t + u_{range} \end{aligned}$$

u_{range} : u_range

Review the Real MPC Code for FTC
